NIDHIPATI

Private reserve attestation

Scope for one tokenized asset and one as-of date. A signed report a buyer can verify offline — without publishing the full portfolio.

Written scope · no calls required
10 working days from complete data
Version 1.0 · 26 Oct 2026

What you get

- **Signed JSON attestation** — reserve lines, liabilities/supply, NAV, verdict, source hashes, and the public key. The buyer verifies it without trusting our server.
- **Human-readable report** — the same numbers with the arithmetic shown: what backs the token, which lines carry a haircut, and what could not be priced.
- **Fail-closed behaviour** — if one reserve line has no price, the report says `incomplete` and does not print a backing ratio. It does not guess.
- **Privacy by construction** — the report carries the minimum needed to recompute NAV. Full wallets, counterparties, and strategy stay out unless you choose to include them.
- **Offline verification pack** — the public key, a one-command check, and a short note your buyer or auditor can keep.

What we need from you

Data

- Reserve lines: asset, quantity, price source, haircut, as-of date.
- Liabilities or token supply for the same date.
- Custodian or issuer sign-off on the source data — one named owner.
- NDA if the data is private. We work from a read-only export; no private keys, no custody, no wallet access.

Decisions

- Which asset and date are in scope.
- Whether the report is public or buyer-only.
- Whether your name and the numbers may appear in an anonymized case study. If not, the standard price applies and nothing is published.
- One written contact for questions. No calls required.

How it runs

1. **Scope (same day).** You confirm the asset, date, and whether the data is private. We confirm price and the one named data owner in writing.
2. **Intake (1–2 days).** You send the reserve and liability export. We check that every row has a source and a price. Missing rows are named, not filled.
3. **Build (3–5 days).** We compute NAV and the backing ratio, sign the report, and write the human-readable version. You see a draft before it is final.

4. **Verification (1–2 days).** We verify the signed file with the published key on a clean machine and send you the exact command.
5. **Delivery (10 working days).** Final JSON, report, public key, and verification note. One retest of agreed corrections is included.

Price and payment

First three single-asset reports

$1,250

Instead of $5,000. In exchange for an anonymized public case study, published only if the report verifies and you approve the wording.

After the first three: $5,000 per asset/date. Issuer or white-label engagements from $50,000.

Payment

- 50% on written scope, 50% on delivery.
- USDC on Base or Solana. The address comes only from a signed invoice, never from chat.
- Invoice is a signed JSON document; the receipt verifies with `nidhipati-proof verify`.
- India (PPP): $625 per report, same scope.

Verification guarantee

If the signed report does not verify offline with the published key, the fee is refunded. This is a statement about the file and the signature — not about the issuer’s solvency, the accuracy of its source data, or the value of the asset.

What this is not

> **Not a statutory audit, legal opinion, or investment advice.** We do not custody funds, issue a token, or guarantee repayment. The issuer remains responsible for the truth of the source data. The report says what was checked, what was not, and which line failed — it does not say “100% safe”.

Verify it yourself

```
nidhipati-reserve verify report.json --pubkey nidhipati-proof.pub
# verdict: backed | underbacked | incomplete
# exit code follows the verdict; a missing price is never treated as zero
```

Synthetic sample: mrpkk.github.io/nidhipati/sample-reserve-report.html — not a client, not a statutory audit. The sample uses invented numbers and is marked as such.
